QUESTION PATTERN

1. For 4 Credit courses (without Practical):

SECTION	TOTAL NO. OF QUESTIONS TO BE SET	NO. OF QUESTIONS TO BE ANSWERED	Mark for each question	TOTAL MARKS
A. Objective	10 (at least 2 questions from each unit)	10	1	10
B. Short Answer	8 (at least 2 questions from each unit)	5(taking at least one from each unit)	3	15
B. Descriptive	8 (at least 2 questions from each unit)	5(taking one from each unit)	10	50
TOTAL				75

2. For 4 Credit courses (with Practical):

a. Theory (2 hours)

SECTION	TOTAL NO. OF QUESTIONS TO BE SET	NO. OF QUESTIONS TO BE ANSWERED	Mark for each question	TOTAL MARKS
C. Objective	5 (at least 2 questions from each unit)	5	1	5
B. Short Answer	5 (at least 2 questions from each unit)	3 (taking at least one from each unit)	3	9
D. Descriptive	5 (at least 2 questions from each unit)	3 (taking at least one from each unit)	12	36
TOTAL				50

b. Practical End Semester

PRACTICAL EXAM (2 Hours)		
Sl No.	CATEGORY	TOTAL MARKS
1	2 Practicals	10 +10 = 20
2	Viva & Record Book	5
TOTAL		25

INTERNAL EXAM			
Sl No.	CATEGORY	TOTAL MARKS	
		Theory	Practical
1	C1	6	4

2	C2	6	4
3	Attendance	5	
TOTAL		25	

QUESTION PATTERN

3. For 4 Credit course Laboratory paper:

LAB PAPER PRACTICAL EXAM (3 Hours)		
Sl No.	CATEGORY	TOTAL MARKS
1	2 Practical's	20 +20 = 40
2	Project	25
3	Record Book	5
4	Viva voce	5
TOTAL		75
INTERNAL EXAMINATION		
1	IE1	10
2	IE2	10
3	Attendance	5
TOTAL		25

4. For 3 Credit courses:

SECTION	TOTAL NO. OF QUESTIONS	NO. OF QUESTIONS TO BE ANSWERED	Mark for each question	TOTAL MARKS
E. Objective	10 (at least 3 questions from each unit)	10	1	10
B. Short Answer	9 (at least 3 questions from each unit)	5 (taking at least one from each unit)	5	25
F. Descriptive	8 (at least 3 questions from each unit)	4 (taking at least one from each unit)	10	40
TOTAL				75

FIRST SEMESTER
DISCIPLINARY MAJOR
MATH100: VECTOR ANALYSIS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. have basic knowledge on scalars and vector product of three and four vectors and its various derivatives.
2. to evaluate the curvature of a curve, tangential and normal component of velocity and acceleration of a moving particle along a space curve.
3. get knowledge about space curves; directional derivative; gradient; vector fields; divergence, curl and flux.
4. get basic knowledge on determining line integral, surface integral, volume integral and their relation.

UNIT I

(15 Lectures)

Scalar and Vector product of three and four vectors, reciprocal system of vectors and its properties, coplanar condition and geometrical interpretation of three and four vectors, differentiation of dot and cross products of vectors.

UNIT II

(15 Lectures)

Velocity and acceleration, tangential and normal component of acceleration, arc length along space curve, unit tangent vector, unit normal vector, principal unit normal, curvature of a smooth curve, scalar and vector point function, gradient of a scalar function and related properties, conservative fields and potentials.

UNIT III

(15 Lectures)

Divergent and curl of vector function and its physical interpretation, vector identities, solenoidal and irrotational of vector, directional derivatives of a scalar function.

UNIT IV

(15 Lectures)

The line integral, surface Integral, volume integral: their physical meaning and related problems. statement of Gauss, Stokes and Green theorem, their physical meaning, properties and related problems.

FIRST SEMESTER
DISCIPLINARY MAJOR
MATH101: CALCULUS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. sketch different types of graphs in cartesian coordinate, use the notions of sequence and series and their convergence. Calculate the limit and examine the continuity of a function at a point and interval, uses of derivatives and successive differentiation.
2. understand the consequences of Rolle's and Mean value theorems for differentiable functions. Know the importance of Taylor's and Maclaurin's expansions.
3. know Fundamental theorem of integral calculus, evaluation of integrals using properties of definite integral and reduction formulae for standard integrals.
4. understanding limits & continuity in two variables and their partial derivatives, total derivatives; Euler's theorem on homogeneous functions.

UNIT I

(15 Lectures)

Functions and graphs of real valued functions; Sequences of real numbers, Convergent sequence, Monotonic sequence, Cauchy sequence; Cauchy's general principle of convergence; Infinite series, Convergent series, Comparison test, Ratio test, Raabe's test. ϵ - δ definition of limit and continuity, standard theorems on limits, Properties of continuous functions defined on closed and bounded intervals (statements with illustrations only), L Hospital's Rule (statements with applications).

UNIT II

(15 Lectures)

Derivatives of real valued functions on intervals; Monotonic function; Sign of the derivatives of a real valued function of a real variable; Maxima and Minima; Rolle's theorem and its geometric interpretation, Mean Value Theorems and its applications; Taylor's and Maclaurin's theorem with Cauchy's form of remainders; Taylor's and Maclaurin's series; expansion of standard functions such as e^x , $\sin x$, $\cos x$, $\log(1+x)$, $(1+x)^n$; Successive differentiation; Leibnitz's theorem.

UNIT III

(15 Lectures)

Anti-derivative; Fundamental theorem of integral calculus; Differentiability of integrals of continuous functions; Evaluation of integrals; Properties of definite integral and evaluation of integrals; Definite integral as limit of sum; Reduction formulae for the functions $\int \sin^n x dx$, $\int \cos^n x dx$, $\int \tan^n x dx$, $\int e^{ax} x^n dx$, $\int \sin^n x \cos^m x dx$ and their combinations.

UNIT IV

(15 Lectures)

Real-valued functions of two variables: limits; Repeated limits; continuity; partial derivatives of first and second orders; Differentiability; Young's theorem and Schwarz's theorem (Statements with applications); The derivation of composite functions; Change of variables; Euler's theorem on homogeneous functions (proof up to two variable case).

FIRST SEMESTER
DISCIPLINARY MAJOR
MATH110: QUANTITATIVE APTITUDE

Full Marks: 100 (3 Credits)

(45 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. understand concepts of mathematics with emphasis on analytical ability and computational skill needed in competitive examinations
2. explain the concepts and use equations, formulae and mathematical expression and relationship in a variety of context
3. handle data collection and analyze their representation in terms of graph and interpretation.

UNIT I

(15 Lectures)

Number series, Surds, Rationalization of surds, Percentage, Profit and Loss, Ratio and Proportion, Partnership, Simple interest and Compound interest.

UNIT II

(15 Lectures)

Time and distance, Time and work, Pipes and cistern, Boats and stream. Types of data, Methods of collection, Concept of data summarization and condensation.

UNIT III

(15 Lectures)

Methods of data representation, Classification of data and their types, Construction of tables (with one or more factors), their general structure and types, Frequency distribution, Principles governing their representation and graphical representation and determination.

6. Hoel P.G. (1971): Introduction to Mathematical Statistics, Asia Publication.

SECOND SEMESTER
DISCIPLINARY MAJOR
MATH160: ELEMENTARY NUMBER THEORY

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. know basic properties of integers and fundamental theorem of arithmetic.
2. understand congruences in the set of integers. Eulers function, Fermat's theorem, Wilson's theorem, Lagrange's theorem and their applications.
3. have a knowledge on Legendre's symbol, Linear congruences, Chinese remainder theorem, congruence of higher degree modulo, Gauss lemma.
4. understand Fibonacci numbers and their properties. Learn about various type of functions. Mobius Inversion formula to solve equations.

UNIT I *(15 Lectures)*

Divisibility in the set of integers; Basic properties; the Division algorithm; GCD; Elementary properties; the Euclidean algorithm; LCM; Primes (in the set of natural numbers); Fundamental theorem of arithmetic. Euclid's proof of the infinitude of primes; Arbitrary gaps in the distribution of primes.

UNIT II *(15 Lectures)*

Congruences in the set of integers modulo a positive integer; Basic properties; complete residue system; Reduced residue system. Euler's ϕ - function; Fermat's theorem; Euler's generalization of Fermat's theorem; applications; Wilson's theorem, Lagrange's theorem.

UNIT III *(15 Lectures)*

Primitive roots. Legendre's symbols, Euler's Criterion, Gauss Lemma, Law of Quadratic Reciprocity, Solution of congruences; Linear congruences; Chinese remainder theorem; Congruences of higher degree modulo a prime.

UNIT IV *(15 Lectures)*

Fibonacci numbers and their properties; Arithmetic functions; Multiplicative functions; Functions such as $\tau(n)$, $\sigma(n)$, $\mu(n)$, $\sigma_k(n)$, $\omega(n)$, $\phi(n)$. Greatest integer function; Elementary properties.

4. Malik S. B.: Basic Number Theory, Vikas Publishing House, 2nd Edition, 1998.

**SECOND SEMESTER
DISCIPLINARY MAJOR
MATH161: ALGEBRA**

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes:

This course will enable the students to:

1. learn elementary operation on matrix, linear dependency of vectors and find rank of matrix, evaluate eigenvalues, eigenvectors and its application in important theorems.
2. understand properties of polynomials over integer, rational, real and complex field and their irreducibility, the importance of roots of real and complex polynomials and learn various methods of obtaining roots.
3. employ De Moivre's theorem in a number of applications to solve numerical problems.
4. enable to solve cubic and biquadratic equations by Cardan's method.

UNIT I

(15 Lectures)

Review on different types of matrices over $\mathbb{R}/\mathbb{C}$; symmetric, skew-symmetric, Hermitian, skew-Hermitian matrix and their properties; linearly dependent and independent vectors, rank of matrix; row-reduced echelon form and normal form of a matrix; determination of eigenvalues and eigenvectors, Cayley-Hamilton theorem and its application, diagonalization theorem.

UNIT II

(15 Lectures)

Polynomials over $\mathbb{Z}, \mathbb{Q}, \mathbb{R}, \mathbb{C}$; addition and multiplication; degrees of a polynomial; division algorithm; roots of a polynomial, Remainder theorem, Factor theorem, synthetic division, expressing polynomial in power of linear factor; GCD, Euclidean algorithm; irreducible polynomials, unique factorization theorem, Eisenstein's irreducibility criterion, tests of irreducibility of polynomials.

UNIT III

(15 Lectures)

Detailed study of roots of a polynomial with real coefficients: Fundamental theorem of algebra; Multiple roots, Common roots, Complex roots, Surd roots, the n^{th} roots of unity. Descartes' rule of signs - Simple applications; Location of roots using Rolle's theorem, Relation between roots and coefficients of a polynomial; Symmetric function of roots; Formation of equation with given roots.

UNIT IV

(15 Lectures)

De Moivre's theorem for integer and rational indices - Application to solution of equation, Expansion of $\sin n\theta$, $\cos n\theta$ and $\tan n\theta$. Solution of a cubic equations by Cardan's method.

5. Fraleigh, John B.: A First Course in Abstract Algebra (Narosa Publishing House), 1999 Edition.

THIRD SEMESTER
DISCIPLINARY MAJOR
MATH200: MODERN ALGEBRA - I

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. learn about the fundamental concepts of binary operations, groups and their unique features.
2. understand the properties subgroups, order of a group, group of prime order, abelian group, dihedral group, quaternion group, general and special linear groups.
3. grasp the concept of cyclic groups, permutation group and their properties; application of Euler-Phi function.
4. learn group of homomorphism, isomorphism; cosets and properties, Lagrange's theorem and its application.

UNIT I

(15 Lectures)

Binary operations, Examples; Groups - Definition; Detailed study of groups such as $\mathbb{Z}$, $\mathbb{Z}_n$, $\mathbb{Q}$, $\mathbb{R}$, $\mathbb{C}$, $M_2(\mathbb{R})$. Cancellation laws; Uniqueness of identity and inverses; Group tables of groups of low order (up to 4); Elementary properties of groups. Definition and properties of Abelian groups, Examples- $U(n)$.

UNIT II

(15 Lectures)

Subgroups and examples, determination of all subgroups $\mathbb{Z}$, product of two subgroups, order of a group and element of a group. Groups of prime order. Examples of Abelian groups including D_n (dihedral groups), Q_8 (quaternion group), $GL(n, F)$ (general linear groups) and $SL(n, F)$ (special linear groups) (where F is any of the fields- $\mathbb{R}$, $\mathbb{Z}$, $\mathbb{Q}$, $\mathbb{Z}_n$).

Unit III

(15 Lectures)

Cyclic groups and properties, Classifications of subgroups of cyclic groups, definitions and examples of Centralizer. Permutation group and properties, cyclic permutations, Even and odd permutations, subgroup of S_n . Applications of Euler-Phi function in cyclic group.

Unit IV

(15 Lectures)

Definition and examples of Homomorphism, Isomorphism and Automorphism. Cayley's theorem. Cosets and their properties; Cosets as equivalence classes; $\mathbb{Z}_n$ as cosets, Lagrange's theorem and its applications.

References:

4. Joseph A. Gallian: Contemporary Abstract Algebra, 9th Edition, CENGAGE Learning, 2015.

THIRD SEMESTER
DISCIPLINARY MAJOR
MATH 201: DIFFERENTIAL EQUATION

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: The course will enable the students to:

1. understand the genesis of ordinary differential equations.
2. learn various techniques of getting exact solutions of solvable first order differential equations and linear differential equations of higher order.
3. grasp the concept of a general solution of a linear differential equation of an arbitrary order and also learn a few methods to obtain the general solution of such equations.
4. understanding partial differential equation and apply a range of techniques to solve first & second order partial differential equations.

UNIT I

(15 Lectures)

Formation of differential equations; equations of first order and first degree; solutions by - separation of variables and substitution; homogeneous equations; linear equations; Bernoulli's equation; exact equations; reduction to exact form by integrating factors.

UNIT II

(15 Lectures)

Linear equations of second and third order with constant coefficients - Complementary functions and Particular integrals for $e^{ax} \sin mx$, $e^{ax} \cos mx$, $x^n \sin mx$, $x^n \cos mx$; Equations of type, Differential equations of first order but higher degrees; Clairaut's equation and singular solution; Geometrical interpretation; orthogonal trajectories.

UNIT III

(15 Lectures)

Linear differential equations of Second order with variable coefficients; Homogeneous equations; Exact equations; Method of variation of parameters; Simultaneous equations; Total differential equation $Pdx + Qdy + Rdz = 0$.

UNIT IV

(15 Lectures)

Order and degree of partial differential equations (PDE), Concept of linear and non-linear partial differential equations, Partial differential equations of the first order, Lagrange's method, Integral surface passing through a given curve, Surfaces orthogonal to a given family of surfaces, Compatible systems of first order equations, Some special type of equation which can be solved easily by methods other than the general method, Charpit's general method.

3. Sneddon, I. N.: Elements of Partial Differential Equation (McGraw Hill). International Edition 1957.
4. Coddington, Earl A.: An Introduction to Ordinary Differential Equations (Prentice-Hall, India), 1998 Edition.

FOURTH SEMESTER
DISCIPLINARY MAJOR
MATH260: REAL ANALYSIS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: The course will enable the students to:

1. understand basic properties of open and closed sets, compact sets, Euclidean spaces and other related important theorems.
2. learn conceptual variations while advancing from one variable to several variables in calculus.
3. relate concepts of partial derivatives with directional derivatives, derivability of a function.
4. gain expertise in extreme values of functions for two variables.

UNIT I

(15 Lectures)

Basic properties of Euclidean distance function in $\mathbb{R}^n$; Neighbourhoods, Open sets, Closed sets, Limit points, Interior points in $\mathbb{R}^n$ ($n = 1, 2, 3$); Bolzano-Weierstrass theorem; Cantor intersection theorem (nested interval), Lindelof covering theorem, Compact sets; Heine-Borel theorem.

UNIT II

(15 Lectures)

Real valued function of several variables: Continuity, Elementary properties of continuous functions; Continuous functions on compact sets; Special cases of continuous real valued functions on closed, Bounded intervals of $\mathbb{R}$: Bounds; Intermediate value theorem; Uniform continuity.

UNIT III

(15 Lectures)

Partial derivatives of a real valued function with domain up to $\mathbb{R}^3$; Existence of directional derivatives; Mean value theorem; Derivability of composites, Differentiability at a point, Condition for differentiability, Jacobians and their properties.

UNIT IV

(15 Lectures)

Reversal of order of derivatives, Schwarz's theorem, Young's theorem, Taylor's theorem, extreme values of a function, Necessary condition for extreme value, Sufficient condition for extreme value (for function of two variables).

4. Bartle, R.G., and Sherbert, D.R.: Introduction to Real Analysis (John Wiley & Sons, Inc), 2000 Edition.

FOURTH SEMESTER
DISCIPLINARY MAJOR
MATH261: NUMERICAL ANALYSIS-I

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. use difference operators and obtain numerical solutions of algebraic and transcendental equations.
2. learn about various interpolation and extrapolation methods.
3. find numerical solutions of system of linear equations and check the accuracy of the solutions.
4. solve initial and boundary value problems in differential equations using numerical methods.

UNIT I

(15 Lectures)

Difference operators and relation between them, Differences of a polynomial, Factorial polynomials. Solutions of Algebraic and Transcendental equations, Bisection method, Iteration method, Regula-Falsi method, Newton-Raphson method.

UNIT II

(15 Lectures)

Difference tables: Forward difference, Backward difference, Divided difference; Newton's forward and backward interpolation formulae, Newton's divided differences formula for interpolation, Lagrange's interpolation polynomials.

UNIT III

(15 Lectures)

Solution of system of linear equations, Gauss elimination method, Gauss-Jordan method, Gauss- Siedel method, Crout's method.

UNIT IV

(15 Lectures)

Numerical solution of differential equations - Taylor series method, Picard's method, Euler's method, Modified Euler's method (single and multi-step method), Runge-Kutta methods (up to second order).

References:

1. Rajaraman, V.: Computer Oriented Numerical Methods (Prentice-Hall of India Pvt. Ltd., New Delhi), 2002 Edition.

3. Kandasamy, P., Thilagavathy, K., and Gunavathy, K.: Numerical Methods, (S. Chand & Co. Ltd., New Delhi), 2003 Edition.
4. Calculus of finite differences and Numerical analysis by Saxena, S Chand & Co.

FIFTH SEMESTER
DISCIPLINARY MAJOR
MATH300: ADVANCED CALCULUS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. learn about Riemann integrability of bounded functions and algebra of R-integrable functions.
2. apply various techniques to identify the convergence of an improper integrals and their condition of absolute and conditional convergence.
3. evaluate line integral and double integrals and realize the interrelationship between repeated and double integrals.
4. relate concepts of pointwise and uniform convergence of sequences and series.

UNIT I

(15 Lectures)

Riemann integral of functions of one variable; Darboux's theorem; conditions for integrability; classes of bounded and integrable functions; properties of integrable functions; inequalities for integrals; Some integrable functions; Fundamental theorem of Calculus; mean value theorems for integrals.

UNIT II

(15 Lectures)

Improper integrals; Integrals of unbounded functions with finite limits of integration; Comparison test for convergence at a of $\int_a^b f(x)$; Beta function; General test for Convergence (finite limits of integration); Absolute convergence (finite limits of integration); Integrals of unbounded functions with infinite limits of integration; Comparison test for convergence at ∞ ; gamma function; Absolute convergence (finite limits of integration); Test for convergence; Abel's theorem, Dirichlet's test.

UNIT III

(15 Lectures)

Evaluation of integrals; Line integral in $\mathbb{R}^n$; Riemann integral of real valued functions of two variables; Evaluation of double integrals, Relation between double and repeated integrals, Change of order of integration in double integrals.

UNIT IV

(15 Lectures)

Sequences of (real valued) functions: pointwise and uniform convergence; properties of uniformly convergent sequences of functions; series of functions; uniform convergence, tests for uniform convergence; properties; term by term integration and differentiation of power series.

4. Malik, S. C. and Arora, S.: Mathematical Analysis (New Age International (P) Ltd., Publishers) 1992 Edition (Reprint 2001).

FIFTH SEMESTER
DISCIPLINARY MAJOR

MATH 301: COMPUTER PROGRAMMING IN C

Full Marks: 100 (Theory 2+Practical 2=4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. understand fundamentals of C, C program structure, process of compiling and running a C program.
2. know input/ output functions, decision making, different types of looping, jumping, different types of functions and functions calls.
3. have knowledge in storage classes, array, multidimensional array, string, different types of string functions, pointers and user defined data types.
4. develop skills for developing and running C programs.

UNIT I: C fundamentals: The C character set, identifiers and keywords. **Data types** : constants, variables and arrays; type declarations; symbolic constants; expressions; statements. **C program structure** : Process of compiling and running a C program. **Operators** (Arithmetic, unary, relational, logical, bitwise, assignment).

Header files – Need for header files, <stdio.h> header files (getchar (), putchar (), scanf(), printf(), gets(), puts()); <math.h> header file (exp(), log(), log10(), sqrt (), cbrt(), pow(x,y), fabs (), sin (), cos (), tan(), asin(), acos(), atan(), round(), ceil(), floor(), copysign()); <stdlib.h> header file (abs(), div(), exit(), system(“cls”)).

Input/Output (I/O): I/O functions, formatted and unformatted input/output. **Control statements:** Decision making and branching (if.. else, switch). **Looping** (while, do .. while, for), Jumping (break, continue, goto), Nested loops. **Pointers** : declaration, address of and value of operator, pointer arithmetic, operation on pointers, advantage & disadvantage of pointers. **Storage classes** (Automatic, Register, External, Static). *(15 Lectures)*

UNIT II: Functions: Overview (definition, declaration), defining a function, categories of function, accessing a function, function prototypes, call by value, call by reference, passing pointer to a function, functions returning pointers, recursion, iteration, Advantages and disadvantages of recursion over iteration. Memory allocation function under standard library functions<stdlib.h> (malloc(), free(), realloc(), calloc()).

Arrays: Defining an array, array initialization, processing an array, passing array to a function, multidimensional arrays, 1-D and 2-D arrays and pointers. **Character & String** : character, string, String functions <string.h> (strcmp (), strlen (), strcmp(), strcat (), strstr()). Character function <ctype.h> (toupper (), tolower ()). Arrays and strings, Pointer and string. **User defined data types : Structures:** defining a structure, structures and arrays, structure within structure. Union, enum and typedef. *(15 Lectures)*

PRACTICALS Practice the following programs. *(30 Lectures)*

1. Roots of quadratic equation $Ax^2+Bx+C=0$.
2. Arrangement a given set of numbers in increasing/decreasing order; calculation of mean.
3. Evaluation e^x , $\sin x$, $\cos x$, $\log(1+x)$ using power series method.
4. Conversion of decimal to binary number and vice versa.
5. Solution of simple/algebraic/transcendental equations; Newton's method and bisection method(real roots only).
6. Addition, subtraction and multiplication of matrices using function.
7. Evaluation of factorial of a positive integer and evaluation of binomial coefficients.
8. Determination of the transpose, determinant of the given matrix.(up to order 4).
9. Determination of the inverse of a given real matrix (up to order 4).
10. Solution of system of equations by Gauss Jordan method.
11. Searching a pattern in a given text and replacing every occurrence of it with another given string.
12. Writing a given number in words using function.

FIFTH SEMESTER
DISCIPLINARY MAJOR
MATH302(a): ANALYTICAL GEOMETRY

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. learn and visualize the fundamental ideas about coordinate geometry, to identify central and non-central conic and their properties like tangent, normal, diameter, asymptotes etc.
2. find relation between Cartesian coordinate, polar coordinate, cylindrical coordinate and spherical coordinate.
3. visualize the fundamental ideas about coordinate geometry and learn to describe some of the surface by using analytical geometry.
4. gain knowledge about regular geometrical figures and their properties.

UNIT I

(15 Lectures)

Change of axes - Invariants; Pairs of straight lines; General equation of second degree; The standard form; Reduction of the general equation to standard form; Conditions for different conics; General conics: Equations of tangents, Normals, Pairs of tangents.

UNIT II

(15 Lectures)

Diameter, Conjugate diameter, Asymptotes, Polar equation of conics, Equation of directrix, Tangent to a conic in polar form.

UNIT III

(15 Lectures)

Space co-ordinates: Rectangular, Cartesian, Cylindrical, Spherical, Angle between two planes; Perpendicular distance of a point from a plane; Bisectors of two planes; Equations of straight lines in space; Co-planarity of two straight lines; Perpendicular distance of a point from a straight line; Shortest distance between two straight lines in space.

UNIT IV

(15 Lectures)

Sphere - plane section and its equation; Sphere through a given circle; Tangent plane; Pole and polar plane; Intersection of two spheres; Radical plane; Equation of a cone with a conic as a guiding curve; Enveloping cone; Mutually perpendicular generators; Tangent planes; Reciprocal cone; Right circular cone; Equation of a cylinder with a conic as a guiding curve; Right circular cylinder.

2. Loney, S. L.: The Elements of Coordinate Geometry, (S. Chand & Co., New Delhi).
3. Das, B.: Analytical Geometry and vector Analysis (Orient Book Co., Calcutta), 1998 Edition. (For Unit III, IV & V)

FIFTH SEMESTER
DISCIPLINARY MAJOR
MATH302(b): ASTRONOMY

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. have the idea about spherical trigonometry, celestial sphere and conversion of coordinate from one system to another.
2. know about rising and setting of stars, atmospheric refraction, different types of time and its equation.
3. have knowledge about seasons, different types of parallaxes, effect on right ascension, declination, longitude and latitude, aberration and eclipse.

UNIT I

(15 Lectures)

Spherical Trigonometry: Section of a sphere by a plane, Great and small circle, Spherical triangles; Formula for spherical trigonometry; Solution of spherical triangle; Position of a point of a sphere.

UNIT II

(15 Lectures)

The celestial sphere: Definition, Annual motion of the sun, System of coordinates, Hour angle, Conversion of coordinates from one system to another, Equinoxes and Solstices.

UNIT III

(15 Lectures)

Rising and setting of stars, Rate of change of zenith distance and azimuth, Motion of the sun, Twilight, Atmospheric refraction, Sidereal time and mean time, Correction of time, Equation of time;

UNIT IV

(15 Lectures)

Seasons, Geocentric parallax, Stellar parallax, Effects on right ascension, declination, Longitude and latitude, Parallactic eclipse; Aberration, Eclipses.

SIXTH SEMESTER
DISCIPLINARY MAJOR
MATH360: COMPLEX ANALYSIS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: The course will the students to:

1. understand the polar and geometrical representation of complex number, the convergence of Power series, term by term integration and differentiation.
2. understand the significance of differentiability and analyticity of complex functions leading to the Cauchy-Riemann equations.
3. relate the concept of Line integral, Green's theorem and Cauchy integral formula.
4. learn Taylor and Laurent series expansions of analytic functions, classify the nature of singularity, poles and residues and application of Cauchy Residue theorem.
5. count the number of zeros of analytic function, calculation of residues using Cauchy's residue theorem and maximum modulus theorem.

UNIT I

(15 Lectures)

Complex numbers; basic properties, conjugate function, distance function (in terms of the absolute value); triangle inequality, parallelogram law; related inequalities; polar representation; magnitude, arguments, roots of a complex numbers, geometry of complex numbers: straight lines, circles in terms of complex numbers.

UNIT II

(15 Lectures)

Set of points (Region) in a complex plane; Limit of a complex function; Continuity of a complex function; Derivability of a complex function; Analytic function; Necessary and sufficient condition for analyticity. Harmonic conjugate function, Construction of analytic function (Milne-Thomson's method)

UNIT III

(15 Lectures)

Sequences and Series; Convergence of sequence, Infinite series, Convergence of a series, absolute convergence, Test for absolute Convergence; Power series; uniform convergence, Cauchy-Hadamard formula for the radius of convergence, circle of convergence.

UNIT IV

(15 Lectures)

Integration of complex valued function; Curves in a complex plane, Line integral in a complex plane (Contour Integrals) Cauchy's integral theorem, Cauchy's integral formula, Cauchy's integral formula for derivatives (statement and examples only), maximum modulus theorem, Liouville's theorem, Taylor's and Laurent Series theorem (statement and examples only)

5. Vasishtha, A. R. and Vasishtha, V.: Complex Analysis, Krishna Prakashan Media Ltd. Meerut, India.

SIXTH SEMESTER
DISCIPLINARY MAJOR
MATH361: MODERN ALGEBRA-II

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. know Normal subgroup, Centre of a group, Quotient group and examples, understand theorems of group homomorphism, isomorphism, automorphisms.
2. basic properties of Rings, Finite integral domains and examples, have a knowledge on various type of ideals, quotient ring, fields.
3. understand ring homomorphisms, kernels, isomorphism, determination of ideals in $\mathbb{Z}$, divisibility in integral domains, units, associates, prime elements, irreducible elements, gcd, Euclidean domain, Principle ideal domain.
4. understand the concept of linear dependence and independence of vectors, basis, linear span, rank-nullity theorem.

UNIT I

(15 Lectures)

Normal subgroups and their properties; Conditions for a subgroup to be normal; Centre of a group; Quotient group, Fundamental theorem of group homomorphism; First, Second and Third isomorphism theorems for groups; Automorphisms; Inner automorphisms; examples.

UNIT II

(15 Lectures)

Basic properties of rings; Characteristic of rings; Finite integral domains; Subrings. Ideals: Principal and Prime ideals, Maximal ideals in a commutative ring with unity; Determination of ideals in $\mathbb{Z}_p$; Quotient ring, $\mathbb{Z}_n$ as a quotient ring, fields: $\mathbb{Q}, \mathbb{R}, \mathbb{C}$.

UNIT III

(15 Lectures)

Ring homomorphisms; Kernels; Isomorphism; Homomorphisms and Isomorphism theorems including the correspondence theorem; Divisibility in integral domains; units, associates, Prime and irreducible elements, Euclidean domain, Principal ideal domain, Unique factorization domains.

UNIT IV

(15 Lectures)

Vector spaces: examples, basic properties; subspaces; homomorphisms or linear maps between vector spaces; isomorphisms; standard homomorphism and isomorphism theorems; direct sum (internal and external); linear dependence and independence; basis, dimension.

SIXTH SEMESTER
DISCIPLINARY MAJOR
MATH362(a): OPERATIONS RESEARCH

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. know how to solve optimization problems using simplex method.
2. learn techniques to solve duality in LPP, assignment and transportation problems.
3. solve integer and mixed integer programming problem, different types of game in LPP.
4. have clear understanding about the fundamentals of Operation Research and its techniques used in different fields like optimization problems, transportation, duality, games etc. and can apply concept and knowledge of Operation Research to solve the problems facing in day-today life.

UNIT I

(15 Lectures)

Simplex method of solution, Minimax theorem, Initial simplex table, Terminal simplex table, Pivot entry, Algorithm of simplex method.

UNIT II

(15 Lectures)

Duality in linear programming problem, Assignment problems, Transportation problem.

UNIT III

(15 Lectures)

Integer programming, Branch bound technique, All integer programming problems and mixed integer programming problem.

UNIT IV

(15 Lectures)

Theory of games, two-person zero-sum games, Maximin-minimax principle, Saddle point, Relation between minimax and maximin game without saddle point, Pure and mixed strategies, Dominance property, Modified dominance property, Reduction of game to linear programming problem and its solution.

SIXTH SEMESTER
DISCIPLINARY MAJOR
MATH362(b): FORTRAN PROGRAMMING

Full Marks: 100 (Theory 2+Practical 2=4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. have knowledge about algorithms, flowchart. FORTRAN fundamentals and input / output statements,
2. understand GO TO statement, branching, loop and nesting of loops.
3. know arrays, input and output of arrays, implied Do notation and sub programs.
4. develop skills for developing and running FORTRAN programs.

Theory (30 Lectures)

UNIT I: Flowcharts, Algorithms - definitions and characteristics;

FORTRAN fundamentals - characters, variables, variable names, syntax, statements, constants, variables and expressions; names, types, evaluation of expressions. **Input-output statements** - unformatted and formatted input - output; integers, reals, complex, double precision, logical variables, data statements. **Library Functions. GO TO statements** - Unconditional and computed GO TO.

UNIT II: Branches and loops - IF and DO statements; nesting of DO loops.

Arrays & subscripted variables - DIMENSION statement, input and output of arrays, implied DO notation. **Subprograms** – Arithmetic statement functions, Function subprogram and subroutine subprogram. Common and equivalence statements.

PRACTICALS (30 Lectures)

1. Evaluation of roots of quadratic equation $Ax^2 + Bx + C = 0$
2. Arranging given set of numbers in increasing/decreasing order, calculation of Mean
3. Evaluation of sum of power series eg. e^x , $\sin x$, $\cos x$, $\log(1+x)$
4. Calculation of HCF/LCM of two integers
5. Evaluation of factorials and binomial coefficients
6. Sieve method for primality test
7. To find the product of two polynomials.
8. Solving simple/algebraic/transcendental equations; Newton's method (real roots only),
9. Matrix operations: sums and products,
10. Transpose, determinant (up to order 4),
11. Inversion of real matrices (up to order 4).
12. Solution of system of equations by Gauss Jordan method.

Text Books:

1. Rajaraman, V.: Computer Programming with Fortran 77 (Tata McGraw Hill Publishing Company), 2002 Edition.

References :

2. Ram Kumar: Programming with Fortran 77 (Tata McGraw Hill Publishing Company), 2002 Edition.

SIXTH SEMESTER
DISCIPLINARY MAJOR
MATH362(c): NUMERICAL METHODS LAB

Full Marks: 100 (4 Credits)

(60 Lectures)

Two (2) experiments must be performed within 3 hours in the End Semester examination.

A minimum of 20 experiments must be performed by the students during the semester.

Besides, the student should be given one project work based on the syllabus

Course objective: The course emphasizes algorithm and programming code development of numerical methods (with C/ Fortran Programming/GeoGebra).

1. **Introduction, Approximation and errors of computation**
Introduction, Importance of Numerical Methods
Approximation and Errors in computation
Uses and Importance of Computer programming in Numerical Methods.
2. **Solutions of Nonlinear Equations**
Bisection Method
Newton Raphson method
Regula-Falsi Method, Secant method
Fixed point iteration method
Rate of convergence and comparisons of these Methods
3. **Solution of system of linear algebraic equations**
Gauss elimination method with pivoting strategies
Gauss-Jordan method
LU Factorization
Iterative methods (Jacobi method, Gauss-Seidel method)
4. **Interpolation**
Newton's Interpolation (forward, backward)
Lagrange interpolation
Least square method of fitting linear and nonlinear curve for discrete data and continuous function
5. **Numerical Differentiation and Integration**
Numerical Differentiation
Numerical Integration: Trapezoidal, Simpson's 1/3, 3/8 rule
6. **Solution of differential equations**
Euler's and modified Euler's method
Runge-Kutta methods for 1st and 2nd order ordinary differential equations
Numerical solution of Partial differential Equation

SIXTH SEMESTER
DISCIPLINARY MAJOR
MATH363(a): MECHANICS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. understand necessary conditions for the equilibrium of particles acted upon by various forces and learn the principle of virtual work for a system of coplanar forces acting on a rigid body.
2. determine the centre of gravity of some materialistic systems and discuss the equilibrium of a uniform cable hanging freely under its own weight.
3. deal with the kinematics and kinetics of the rectilinear and planar motions of a particle including the constrained oscillatory motions of particles.

UNIT I

(15 Lectures)

Coplanar forces: Reduction and equilibrium of coplanar forces, General condition of equilibrium of any system of coplanar forces; Solution of problems on equilibrium of heavy bodies such as uniform rods, Solid spheres resting on plane surfaces, Friction.

UNIT II

(15 Lectures)

Centre of gravity of - thin uniform rod, Uniform lamina, Triangular lamina, rectangular lamina, CG of an arc, Circular arcs, Sector of a circle and sectoral area. CG of plane area; CG of area of loop; Centre of gravity of an enclosed area.

UNIT III

(15 Lectures)

Motion in a straight line and a plane, Velocity and acceleration; Radial and transverse velocities and acceleration, Angular velocity and acceleration, Tangential and normal acceleration, Relative motion, rectilinear motion, Motion in straight line with constant acceleration, Simple Harmonic Motion (SHM).

UNIT IV

(15 Lectures)

Projectiles - Projectile to pass through a given point, Range on an inclined plane; Motion of a particle in resisting medium whose resistance varies as (i) velocity (ii) square of velocity. Impact of two bodies; laws of elastic impact; direct and oblique impact.

SIXTH SEMESTER
DISCIPLINARY MAJOR
MATH363(b) DISCRETE MATHEMATICS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. learn about partially ordered sets, lattices and their types.
2. understand Boolean algebra and Boolean functions, logic gates, switching circuits and their applications.
3. solve real-life problems using finite-state and Turing machines.
4. assimilate various graph theoretic concepts and familiarize with their applications.

UNIT I

(15 Lectures)

Definitions, Examples and basic properties of partially ordered sets (poset), Order isomorphism, Hasse diagrams, Dual of a poset, Duality principle, Maximal and minimal elements, least upper bound and greatest upper bound, Building new poset, Maps between posets.

UNIT II

(15 Lectures)

Lattices as posets, Lattices as algebraic structures, Sublattices, Products and homomorphisms; Definitions, examples and properties of modular and distributive lattices; Complemented, relatively complemented and sectionally complemented lattices.

UNIT III

(15 Lectures)

Boolean algebras, De Morgan's laws, Boolean homomorphism, Representation theorem; Boolean polynomials, Boolean polynomial functions, Disjunctive and conjunctive normal forms, Minimal forms of Boolean polynomials, Quine-McCluskey method, Karnaugh diagrams, Switching circuits and applications.

UNIT IV

(15 Lectures)

Finite-state machines with outputs, and with no output; Deterministic and non-deterministic finite-state automaton; Turing machines: Definition, examples, computations.

SEVENTH SEMESTER
DISCIPLINARY MAJOR
MATH400: ADVANCED COMPLEX ANALYSIS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. classify the nature of singularity, poles, residue and application of Residue theorem to evaluation of definite integrals.
2. understand properties and classification of bilinear transformation.
3. know maximum and minimum modulus principle and related functions and theorems such as meromorphic functions, argument principle, Schwarz's lemma, Rouché's theorem and inverse function theorem.
4. have knowledge in analytic continuation of a curve, gamma functions and its properties.

UNIT I

(15 Lectures)

Zeros of an analytic function, Singularities of a function, removable singularities, Pole and essential singularities, Fundamental theorem of algebra, Residue theorem and its applications to the evaluation of definite integrals, Contour Integration.

UNIT II

(15 Lectures)

Bilinear transformations, their properties and classifications. Definitions and examples of Conformal mappings, Necessary and Sufficient condition of conformal mapping, Cross-ratio, Linear transformation, bilinear transformation and its normal form, Elliptic, Hyperbolic, and Parabolic transformations. The transformation of $w = z^n$, $z = \sqrt{w}$, $w = e^z$, $w = \log z$, transformation of trigonometric function.

UNIT III

(15 Lectures)

Maximum modulus and Minimum modulus principle, Meromorphic functions. The argument principle, Schwarz lemma, Rouché's theorem. Inverse function theorem, Analytic Continuation, Uniqueness of direct analytic continuation.

UNIT IV

(15 Lectures)

Uniqueness of analytic continuation along a curve. Power series method of analytic continuation, Schwarz Reflection principle, Weierstrass' factorization theorem. Gamma function and its properties. Riemann Zeta function. Riemann's functional equation. Runge's theorem. Mittag-Leffler's theorem.

SEVENTH SEMESTER
DISCIPLINARY MAJOR
MATH401(a): ORDINARY DIFFERENTIAL EQUATIONS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. learn various techniques of getting exact solutions of solvable first order differential equations and linear differential equations of higher order.
2. understand Picard's method of obtaining successive approximations of solutions of first order differential equations which guarantees a unique solution on some interval of the given differential equation.
3. know the concept of a general solution of a linear differential equation of an arbitrary order and also learn a few methods to obtain the general solution of such equations.
4. find solution method for higher order differential equations.
5. formulate mathematical models in the form of ordinary differential equations to suggest possible solutions of the day-to-day problems arising in physical, chemical and biological disciplines.

UNIT I

(15 Lectures)

Picard's method of successive approximations and the statement of Picard's theorem for the existence and uniqueness of the solutions of the first order differential equations. Statement of existence and uniqueness theorem for linear differential equations, General theory of linear differential equations of second order with variable coefficients, Solutions of homogeneous linear ordinary differential equations of second order with constant coefficients.

UNIT II

(15 Lectures)

Transformations of the equation by changing the dependent/independent variable, Method of variation of parameters and method of undetermined coefficients, Reduction of order, Principle of superposition for a homogeneous linear differential equation, linearly dependent and linearly independent solutions on an interval, Wronskian and its properties.

UNIT III

(15 Lectures)

Concept of a general solution of a linear differential equation, Linear homogeneous and non-homogeneous equations of higher order with constant coefficients, Euler-Cauchy equation, Method of variation of parameters and method of undetermined coefficients, Inverse operator method.

UNIT IV

(15 Lectures)

Power series method, Legendre's equation, Legendre polynomials, Rodrigue's formula, Orthogonality of Legendre polynomials, Frobenius method, Bessel's equation, Bessel functions and their properties, Recurrence relations.

References:

SEVENTH SEMESTER
DISCIPLINARY MAJOR
MATH401(b): GRAPH THEORY

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. appreciate the definition and basics of graphs along with types and their examples.
2. understand the definition of a tree and learn its applications to fundamental circuits.
3. know the applications of graph theory to network flows.
4. understand the notion of planarity of a graph.

UNIT I

(15 Lectures)

Paths, Circuits and Graph Isomorphisms Definition and examples of a graph, Subgraph, Walks, Paths and circuits; Connected graphs, disconnected graphs and components of a graph; Euler and Hamiltonian graphs, Graph isomorphisms, Adjacency matrix and incidence matrix of a graph, Directed graphs and their elementary properties.

UNIT II

(15 Lectures)

Trees and Fundamental Circuits Definition and properties of trees, Rooted and binary trees, Cayley's theorem on a counting tree, Spanning tree, Fundamental circuits, Minimal spanning trees in a connected graph.

UNIT III

(15 Lectures)

Cut-Sets and Cut-Vertices Cut-set of a graph and its properties, Fundamental circuits and cut-sets, Cut- vertices, Connectivity and separability, Network flows, 1- isomorphism and 2- isomorphism.

UNIT IV

(15 Lectures)

Planar Graphs Planar graph, Euler theorem for a planar graph, Various representations of a planar graph, Dual of a planar graph, Detection of planarity, Kuratowski's theorem.

SEVENTH SEMESTER
DISCIPLINARY MAJOR
MATH402(a): NUMERICAL ANALYSIS-II

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. solve algebraic and transcendental equations by numerical method using Bisection, false position, fix point iteration, Newton's and secant methods.
2. learn techniques to solve linear systems by numerical method using Cayley Hamilton theorem, power method and curve fitting.
3. solve differentiation and integration by numerical methods using Trapezoidal rule, Simpson's rule, Weddle rule and Richardson extrapolation.
4. analyze and solve initial and boundary value problems of differential equations by numerical method using Euler, Runge-Kutta, Multi-Step, Finite Difference and Shooting methods.

UNIT I

(15 Lectures)

Round-off error and computer arithmetic, Local and global truncation errors, Algorithms and convergence; Bisection method, False position method, Fixed point iteration method, Newton's method and Secant method for solving equations.

UNIT II

(15 Lectures)

Eigenvalues and Eigenvectors: Cayley Hamilton theorem, Power method for finding largest Eigen value. Curve fitting: Least square curve fit-Straight line fitting, Parabolic curve fitting, fitting of exponential curve, Fitting of other curves.

UNIT III

(15 Lectures)

First order and higher order approximation for first derivative, Approximation for second derivative; Numerical integration: Trapezoidal rule, Simpson's rule, Weddle rule and its error analysis, Extrapolation, Richardson extrapolation.

UNIT IV

(15 Lectures)

Euler's method, Runge-Kutta methods, Higher order one step method, multi-step methods; Finite difference method, Shooting method.

SEVENTH SEMESTER
DISCIPLINARY MAJOR
MATH402(b): METRIC SPACE

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. understand several standard concepts of metric spaces and their properties like openness, closedness, completeness, Bolzano-Weierstrass property, compactness, and connectedness.
2. identify the continuity of a function defined on metric spaces and homeomorphisms.

UNIT I

(15 Lectures)

Definition and examples of metric spaces, Open spheres and closed spheres, Neighbourhoods, Open sets, Interior, exterior and boundary points, Closed sets, Limit points and isolated points, Interior and closure of a set, Boundary of a set, Bounded sets, Distance between two sets, Diameter of a set, Subspace of a metric space.

UNIT II

(15 Lectures)

Cauchy and Convergent sequences, Completeness of metric spaces, Cantor's intersection theorem, Dense sets and separable spaces, nowhere dense sets and Baire's category theorem, Continuous and uniformly continuous functions, Homeomorphism, Banach contraction principle.

UNIT III

(15 Lectures)

Compact spaces, Sequential compactness, Bolzano-Weierstrass's property, Compactness and finite intersection property, Heine-Borel theorem, Totally bounded sets, Equivalence of compactness and sequential compactness, Continuous functions on compact spaces.

UNIT IV

(15 Lectures)

Separated sets, Disconnected and connected sets, Components, Connected subsets of $\mathbf{R}$, Continuous functions on connected sets.

EIGHTH SEMESTER
DISCIPLINARY MAJOR

MATH460(a): PARTIAL DIFFERENTIAL EQUATION

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. learn different techniques to solve first and second order partial differential equations.
2. understand and solve homogeneous and non-homogeneous equations with constant coefficients.
3. model physical phenomena using partial differential equations such as the heat and wave equations

UNIT I

(15 Lectures)

Order and degree of Partial differential equations (PDE), Concept of linear and non-linear partial differential equations, Partial differential equations of the first order, Lagrange's method, some special type of equation which can be solved easily by methods other than the general method, Charpit's general method.

UNIT II

(15 Lectures)

Classification of linear partial differential equations of second order, Homogeneous and nonhomogeneous equations with constant coefficients.

UNIT III

(15 Lectures)

Partial differential equations reducible to equations with constant coefficient, Second order PDE with variable coefficients, Classification of second order PDE, Reduction to canonical or normal form; Monge's method; Solution of heat and wave equations in one and two dimensions by method of separation of variables.

UNIT IV

(15 Lectures)

Euler's equation for functional containing first order and higher order total derivatives, Functionals containing first order partial derivatives, Variational problems in parametric form, Invariance of Euler's equation under coordinates transformation.

EIGHTH SEMESTER
DISCIPLINARY MAJOR
MATH460 (b): FLUID DYNAMICS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. understand the various properties of fluids and their influence on fluid motion and analyze a variety of problems in fluid dynamics.
2. adopt the kinematics and kinetics of fluid motions to understand the equation of continuity in cartesian, cylindrical polar and spherical polar coordinates which are used to derive Euler's equations and Bernoulli's equation.
3. deal with two-dimensional fluid motion using the complex potential and also to understand the concepts of sources, sinks, doublets
4. understand in detail the vortex motion.

UNIT I

(15 Lectures)

Properties of fluids. Newtonian and non-Newtonian fluids, Viscous and Inviscid fluids. Some useful results of vector analysis. Methods of describing fluid motion; Lagrangian and Eulerian method. Velocity and acceleration of a fluid particle. Equation of continuity in - cartesian co-ordinates, cylindrical coordinates, spherical polar coordinates.

UNIT II

(15 Lectures)

Irrotational motion or motion of potential kind, Stream-lines, Path of a particle, Stream tube, Vortex lines. Potential flow. Euler's equation of motion for inviscid flow; Euler's equation of motion in spherical co-ordinates, cartesian co-ordinates, cylindrical coordinates, spherical polar coordinates. Barotropic flow, Bernoulli's Equation of motion, Helmholtz's equation.

UNIT III

(15 Lectures)

Motion in two-dimensions: Stream function or current function, Physical significance of stream function. Spin components in terms of stream function. Irrotational motion in two-dimension. Complex potential, magnitude of velocity, Complex potential for some uniform flows, Source and sinks, Complex potential due to source, Doublet in two dimensions.

UNIT IV

(15 Lectures)

Vortex motion; Vorticity, Vorticity components, Vortex line, Vortex tube and vortex filament, Helmholtz's vorticity theorem. Properties of vortex tube, Rectilinear vortices, two vortex filaments, vortex pair, vortex doublet or dipole, motion of any vortex. Kirchhoff vortex theorem, General system of vortex filament. Navier-Stokes equation for viscous fluid.

2. L.D., Landau & E. N. Lipschitz (Fluid Mechanics).
3. G. K., Batchelor (An Introduction to Fluid Mechanics)
4. Kundu and Cohen (Fluid Mechanics).

EIGHTH SEMESTER
DISCIPLINARY MAJOR
MATH461 (a): CLASSICAL MECHANICS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. identify the motion of a mechanical system using Lagrange-Hamilton formalism.
2. apply the formalism of Lagrangian and Hamiltonian in generating equations of motion for complicated mechanical systems of classical mechanics.
3. compare Lagrangian and Hamiltonian formalism.
4. understand and analyze canonical transformations.

UNIT I

(15 Lectures)

Generalized coordinates; Holonomic & non-holonomic systems; D'Alembert's principle; Lagrange's equations; Calculus of variations.

UNIT II

(15 Lectures)

Hamilton's principle, Lagrange's equations from Hamilton's principle, Extension of Hamilton's Principle to non-conservative and non-holonomic systems.

UNIT III

(15 Lectures)

Hamilton's equations of motion, Conservation theorems and physical significance of Hamiltonian, Hamilton's equations from variational principle, Principle of least action.

UNIT IV

(15 Lectures)

Equations of canonical transformation; Integral invariants of Poincare'; Lagrange and Poisson brackets as canonical invariants, Equations of motion in Poisson bracket notation; Infinitesimal contact, Transformations.

2. Douglas Gregory R, Classical Mechanics, Cambridge University Press

EIGHTH SEMESTER
DISCIPLINARY MAJOR
MATH461(b): LINEAR ALGEBRA

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. solve the system of linear equations with the help of matrix operations. Learn vector spaces and its basic properties.
2. understand the concept of linear dependence and independence of vectors, homomorphism and isomorphism theorems.
3. learn about properties of vector space axioms for the set $L(V, W)$ of linear maps from V to W and also learn the matrix of linear transformation in $L(U, W)$, change of basis theorem, Rank - Nullity theorem.
4. calculate characteristic roots, characteristic polynomials and characteristic vectors of matrix of a linear transformation and learn Diagonalization theorem.

UNIT I

(15 Lectures)

System of linear equations, Matrices and elementary row operation, Row reduction and Echelon forms, Matrix multiplication, Invertible matrices and the inverse of a square matrix, Trace of a matrix; Rank of a matrix and its applications in solving system of linear equations.

UNIT II

(15 Lectures)

Definitions of field and vector space with examples; Subspaces, Quotient space, Direct sum; Linear independent and dependent sets; Basis, Dimension, Linear span; Homomorphisms or linear maps between vector spaces; Isomorphisms; Standard homomorphism and isomorphism theorems.

UNIT III

(15 Lectures)

Vector space axioms for the set $L(V, W)$ of linear maps from V to W ; Dual space; Linear transformation and the matrix of a linear transformation in $L(V, W)$; Change of coordinates, Change of basis theorem; Rank and nullity of a linear transformation; Rank - nullity theorem; Equality of rank of a linear transformation and rank of the associated matrix.

UNIT IV

(15 Lectures)

Characteristic roots, Characteristic polynomial and equation, Characteristic vector of matrix of a linear transformation; Determination of Eigen values and Eigen vectors, Cayley-Hamilton theorem and its applications, Diagonalization theorem.

EIGHTH SEMESTER
DISCIPLINARY MAJOR
MATH462: TOPOLOGY

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. know definition and examples of topological space, subspace topology, continuity and related concepts, product topology, quotient topology, Lindelöf spaces and separable space.
2. understand connected space, component and local connectedness.
3. have knowledge about compact spaces, compact and locally compact spaces and Tychonoff's theorem.

UNIT I

(15 Lectures)

Definition and examples of topological spaces; Basis and sub basis; Order topology; Subspace topology. Continuity and related concepts; Product topology; Quotient topology; Countability axioms; Lindelof spaces and separable spaces.

UNIT II

(15 Lectures)

Connected spaces, Generation of connected sets; Component, Path component; Local connected- ness, local path-connectedness.

UNIT III

(15 Lectures)

Compact spaces; Limit point compact and sequentially compact spaces; Locally compact spaces; One point compactification; Finite product of compact spaces, Statement of Tychonoff's theorem (Proof of finite product only).

UNIT IV

(15 Lectures)

Separation axioms; Urysohn's lemma; Tietze's extension theorem; Urysohn's embedding lemma and Urysohn's metrization theorem for second countable spaces.

EIGHTH SEMESTER
DISCIPLINARY MAJOR
MATH463: PROBABILITY THEORY

Full Marks: 100

(4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. appreciate the importance of probability distribution of random variables
2. establish the joint distribution of two random variables in terms their correlation and regression.
3. understand central limit theorem which shows that the empirical frequencies of so many natural populations exhibit normal distribution.
4. apply various probability distributions.

UNIT I

(15 Lectures)

One-dimensional random variables, Discrete random variables, Binomial distribution, Continuous random variables, Uniformly distributed random variables, Cumulative distribution functions.

UNIT II

(15 Lectures)

Two-dimensional random variables, Marginal and conditional probability distribution, Independent random variables, Distribution of product and quotient of independent random variables.

UNIT III

(15 Lectures)

Expected value of a random variable, Properties of expected value, Variance of a random variable, Properties of variance of a random variable, Chebyshev's inequality, Simple problems, Correlation coefficient, Regression of the mean.

UNIT IV

(15 Lectures)

Binomial distribution, Poisson distribution, Poisson distribution as an approximation of the to the binomial distribution, Poisson process, Geometric distribution, Normal distribution, Properties of the normal distribution, Tabulation of the normal distribution.

EIGHTH SEMESTER
DISCIPLINARY MAJOR
MATH464(a): ADVANCED MECHANICS

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. know the use of reciprocal coordinates, pedal coordinates.
2. learn that a particle moving under a central force describes a plane curve and know the Kepler's laws of the planetary motions, which were deduced by him long before the mathematical theory given by Newton.
3. determine the kinetic energy of a rigid body about a fixed-axes.
4. analyze impulsive motion using the laws of motion.

UNIT I

(15 Lectures)

Motion on rough curve; Cycloidal motion with resistance. Velocity and acceleration in polar co-ordinate

UNIT II

(15 Lectures)

Motion of a particle under central forces, use of reciprocal coordinates, Use of pedal coordinate and pedal equations, Kepler's laws of planetary motion.

UNIT III

(15 Lectures)

Kinetic energy of a rigid body rotating about a fixed-axes, Momental ellipsoid; Equimomental system; Coplanar distributions, General motion of a rigid body.

UNIT IV

(15 Lectures)

Two-dimensional rigid body dynamics; problems illustrating the laws of motion, Laws of conservation, Impulsive motion.

Reference:

1. F.Chorton : Textbook of dynamics, CBS Publishers and distributors, Delhi.
2. M.Ray and GC Sharma: Textbook of Dynamics, S.Chand.

EIGHTH SEMESTER
DISCIPLINARY MAJOR
MATH464(b): MATHEMATICAL LOGIC

Full Marks: 100 (4 Credits)

(60 Lectures)

Course Learning Outcomes: This course will enable the students to:

1. learn the syntax of first-order logic and semantics of first-order languages.
2. understand the propositional logic and basic theorems like compactness theorem and post-tautology theorem.
3. learn proof in first order logic like meta theorem, consistency and completeness

UNIT I

(15 Lectures)

First-order languages, Terms of language, Formulas of language, First order theory.

UNIT II

(15 Lectures)

Structures of first order languages, Truth in a structure, Model of a theory, Embeddings and isomorphism.

UNIT III

(15 Lectures)

Syntax of propositional logic, Semantics of propositional logic, Compactness theorem for propositional logic, Proof in propositional logic, Meta theorem in propositional logic, Post tautology theorem.

UNIT IV

(15 Lectures)

Proof in first-order logic, Meta theorems in first-order logic, Some meta theorem in arithmetic, Consistency and completeness.
